Introduction

High stakes assessment involves testing students for purposes such as grade level retention or advancement, high school graduation, selection for special programs or services, or for other "high stakes" consequences. State-wide performance assessments, standards-based tests, and other assessments used to determine the placement or type of educational program a student should receive are examples of high stakes assessments. Tests that might be used to determine the type of high school graduation certificate or diploma are also considered high stakes assessments.

Issues surrounding the high stakes assessment of English language learners (ELLs) were the focus of an

invitational symposium sponsored by the U.S. Department of Education, Office of Bilingual Education and Minority Languages Affairs (OBEMLA). The symposium was held August 26-27, 1997 in Washington, D.C.

The need for the symposium grows out of concerns raised by educators and policy makers alike about how to ensure appropriate and equitable inclusion of ELLs in high stakes assessments. In many states and local school districts ELLs are routinely excluded from participating in such assessment activities. In others, ELLs are inappropriately included in the testing programs without adequate accommodations that take into account the level of English language fluency the students bring with them to the testing situation. The President's recent proposal to offer a national test and the many statewide standards-based assessments in preparation provided additional urgency to hold such a symposium.

Other reasons for the symposium relate to the requirements for assessing ELLs contained within Title I and Title VII of the *Improving America's Schools Act of 1994*. Specifically, for those ELLs participating in Title I, the legislation calls for their assessment to the extent practicable and in a manner that yields the most accurate results. In order to meet eligibility requirements for Title I funding, states must have their accountability and testing systems in place by the year 2000. These systems must include the assessment needs of ELLs. Furthermore, new Title VII evaluation requirements state that districts receiving Title VII funds provide information to the U.S. Department of Education every two years concerning ELLs' progress in English proficiency, mathematics, language arts, and reading in both English and their native language.

Finally, there is the larger issue of helping the public at large, The Congress, and state and local policy makers better understand the progress ELLs make in our schools and the difficulties faced in fairly and appropriately assessing their academic development. Poor policy decisions have resulted from a misunderstanding of the education of ELLs and from an inability to show student progress. A research agenda is needed to direct resources and attention to the critical questions of when and how to appropriately assess ELLs.

Critical questions of national importance regarding ELLs and assessment:

1. At what point does testing a child in the second language yield meaningful results?
2. What accommodations are appropriate for testing ELLs?
3. What role does native language assessment play in high stakes testing?

Symposium Participants

In order to address each of these questions, 52 participants from diverse areas of the education community were identified and invited to participate in the two-day symposium. The participants represented a broad cross section of stakeholders concerned with the education of ELLs in this nation. Administrators of district, state, and federal programs for ELLs were involved, as well as directors of research institutes and information centers, professional education associations, technical assistance centers, civil rights/advocacy groups and independent consultants. Several representatives from OBEMLA participated in the conference, including its Director, Delia Pompa. Administrators of related federal programs also were invited, including representatives of U.S. Department of Education's Title I programs and the Office of Educational Research and Improvement (OERI). In addition, representatives of influential education organizations attended,

including the Chief State Schools Officers, Educational Testing Service (ETS), and the American Educational Research Association (AERA). A complete list of participants is contained in Appendix A.

Building Consensus

Prior to attending the symposium, participants were asked to consider assessment practices in their districts or states, test development efforts underway, as well as existing research related to: students' readiness for English language testing; appropriate testing accommodations for ELLs and the consequences of exclusion; and the role native language assessment could play in high stakes testing and assessment. Responses to these issues served as a survey of current practice which was shared with the participants on the first day of the symposium.

Participants were assigned to one of three panels corresponding to the three questions posed in the Introduction above. Facilitators for the three panels were Shelly Spiegel-Coleman, an English as a second language consultant at the Los Angeles County Office of Education; Diane August, a researcher and consultant on the education of English language learners; and Cecilia Navarrete, consultant and adjunct Associate Professor at New Mexico Highlands University.

Each panel was charged with the task of creating a specific, targeted research agenda pertaining to one of the questions cited above. In order to define a research agenda, the participants met in their respective panels to first define the issue(s) and their implications for inclusion of ELLs in high stakes assessments. A key part of this process was articulating a set of researchable sub-questions that would help to explicate or further clarify the larger question to be addressed by the panel. After sub-questions and issues were identified and discussed, participants prioritized their questions, selecting 10 to 15 fundamental or primary questions that need to be answered. Part of the task also involved separating out policy issues from needs for research, a task not easily achieved since many research questions about inclusion of ELLs in assessments are linked to matters of policy.

Next, the panel participants selected what they believed to be the five most important sub-questions, a process that helped to prioritize the research needs related to each of the symposium's three broad research questions. These questions were then shared with all participants and discussed in a plenary session, which brought together all three panels.

The final step in the conference involved developing a research plan to address each of the three symposium questions. Meeting in the three panels, participants identified existing research, research underway, and data bases that could be used to begin answering research questions posed by the three panels. Participants also identified researchers, organizations, school districts, and other groups who collect data that might be reanalyzed or used to answer questions raised by the panelists. Additionally, panelists identified organizations with whom partnerships might be formed to fund and support research on assessment of ELLs, including organizations such as the Council of Chief State School Officers, AERA, ETS, and government agencies, such as the U.S. Department of Education's Office of Educational Research and Improvement. The results of these deliberations in each panel were subsequently presented to the entire participant group in a plenary session on the second day of the symposium.

Building a Research Agenda

The following sections summarize the participants' proposed research agenda for the three fundamental questions concerning the high stakes assessment of ELLs.

At What Point Does Testing a Child in a Second Language Yield Meaningful Results?

Those responsible for outlining a research agenda for this question began their inquiry by restating the question. This restatement was necessary in order to capture the difficulty in determining the precise point when all students will be ready for such testing. The panel's revised question was: "When is there a higher probability that the results from testing in the second language are valid?"

The panelists agreed that research is needed to determine the point in time along the continuum of developing English proficiency an ELL can take a high stakes test in English and have the results reflect an accurate picture of achievement beyond a score that purely reflects chance. In order to fully explore this question, the panel recommended the use of multiple sources of data. The first task would be to review existing data bases at both the district and state levels. Questions such data might answer include:

- **What kinds of language proficiency assessments are used in both the native language and in English?**
- **What different programs and instructional practices are available to ELLs?**
- **What are the students' background characteristics and their results from high stakes testing?**

The panel also recommended conducting survey research to more accurately describe the background characteristics of ELLs. Data on language proficiency (listening, speaking, reading and writing), coupled with data describing program services, such as length of time in the program, first language literacy, and program type, could be used to assist administrators and policy makers create guidelines for including ELLs in high stakes assessment.

In order to more clearly define these conditions, research needs to be conducted to develop profiles of subgroups of ELLs along a second language acquisition continuum, beginning with students who are pre-literate in both English and their native language. The second group to be profiled should include students who are literate in their native language, but who have had no exposure to English. A third subgroup should include students who are at the point where English language testing would yield valid results. Information from these profiles could then be used to determine what constellations of characteristics of ELLs create salient profiles that lead to valid results on a high stakes test.

A third issue meriting research is determining when pre-literate students with limited or interrupted schooling could be expected to reach established standards of the district and state. Research has indicated that for pre-literate students, especially older students, the amount of time necessary to reach the point at which English language testing would yield valid results is longer than for other ELLs. The panel recommended that valid diagnostic achievement assessments for pre-literate students need to be identified. In addition, research needs to be undertaken to determine how many of these students there are and where they are located.

A fourth issue this panel recommended for examination concerns the effects cultural bias, bilinguality, and different regional/social varieties of English have on test validity and student performance. Research also is needed on the effect test item and response format have on test validity and student performance.

A final recommendation included the examination of existing data and research literature to develop "think pieces." Such think pieces would complement and support the research. One proposed think piece would examine the history of high stakes testing as it relates to the treatment of English language learners, including who is exempted, and the criteria for exemption. Another needed think piece involves determining what exactly is tested in high stakes assessment and the purposes of such assessment. Other areas might address the implications of high stakes testing for legislation, for school districts, and for students, and the future direction of such testing in terms of national tests and state graduation requirements. In addition the implications of such testing for instructional issues and classroom practices should be examined.

Research Recommendations:

1. At what point along the language proficiency continuum does performance on a high stakes test yield valid results above chance? Is this point a function of time?
2. What are the constellations of characteristics of limited English proficient students that create a series of student profiles that would lead to valid results on a high stakes test?
3. At what point can preliterate limited English proficient students with limited and/or interrupted schooling be expected to reach established standards of the district and state?
4. What are the effects on test validity and student performance of: (a) cultural bias (background knowledge, world view, etc.); (b) bilinguality (proficiency in each language); (c) item and response format; and (d) different regional/social varieties of English.

[\(Return to Table of Contents\)](#)

What Accommodations are Appropriate for Testing ELLs?

The panel discussed the issue of whether the purpose of high stakes assessment is to do the best job possible of measuring what ELLs know and can do or whether it is to determine how they compare with their fully English-proficient peers. Different goals presuppose entirely different methods of incorporating these students into high stakes testing. If the purpose is to find out how they compare with their peers, one might provide no modifications at all. If, on the other hand, the purpose is to find out as much as possible about their knowledge and skills, one might provide as many modifications as necessary. Between these two extremes, there is a continuum of options that entail compromises.

The panel formulated three principles that should undergird any recommendations for accommodating ELLs in high stakes assessments. The first is that ELLs should be included in assessment systems for accountability purposes. Inclusion can take two forms-- full inclusion in which ELLs are given the same assessments as their fully English proficient peers or partial inclusion in which they take a standard assessment with accommodations or an alternative assessment. The second principle is that accommodation should be applied to a broad range of activities including test development, test preparation of students, test administration, student response modes, scoring, benchmarking results, and reporting student outcomes. Third, assessments should mainly be used to help educators improve instruction.

In order to develop a research agenda inclusive of all possible accommodations, the panel identified possible methods of incorporation. From the onset, high stakes assessments should be developed with ELLs in mind. They should be considered in the development of the test construct, framework, and individual items, and

they should be included in sufficient numbers in the sample used to norm the assessments. Prior to the administration of assessments, ELLs should be provided with a review of the content to be covered in the assessment and receive practice and coaching with the test format.

Strategies to include ELLs in assessment and accountability systems, when they are unable to take the standard version of the test, might include the use of native language assessments, bilingual versions of the assessment, alternative modes of response, and portfolios of their work. Teacher judgements of student work might serve as alternatives to taking the tests.

During test administrations, modifications might also be made. Procedures currently in use that need further development and evaluation include: extra time, the use of glossaries or dictionaries, reading the directions aloud in English and/or the native language, repeating the instructions, simplifying the instructions, providing a test administrator familiar to the students, providing small group or individual administrations of the assessment, and providing for multiple testing sessions.

Another issue in some types of high stakes assessment of subject matter knowledge of ELLs is the errors that result from inaccurate and inconsistent scoring of open-ended or performance-based measures. The development of scoring rubrics and procedures for constructed response items that are sensitive to the language and cultural characteristics of ELLs is needed. The Council of Chief State School Officers recently developed a Scorer's Training Manual to be used by states and school districts to aid in the scoring of ELLs' answers to open-ended mathematics questions. This manual will be piloted with ELLs who participated in the 1996 National Assessment of Educational Progress math test.

An additional issue is the need for benchmarks to determine when ELLs have attained those precursor skills and knowledge already possessed by students who arrive in school speaking English. Because of the difficulties in assessing ELLs, it may be important to assess their access to necessary resources and conditions, such as adequate and appropriate instruction.

Research Recommendations

There is a critical need for research to determine how to best assess first and second language development and literacy. To assess language proficiency appropriately, both discrete language skills (e.g., vocabulary, grammar, etc.) as well as more authentic and holistic uses of language should be assessed.

The second area of need is to determine when ELLs should take the same subject area assessments as fully English proficient students; when they should take an accommodated version; when they should take an alternative assessment; and when alternative procedures such as teacher judgement or score prediction should be used. Panelists recommended that a large-scale survey of current practices be conducted.

A third suggestion for research involves how to effectively accommodate ELLs in high stakes assessments. The panel recommended that several studies be undertaken to address this question. A large scale survey needs to be conducted of state and district practices. Once promising accommodations have been identified, studies need to be initiated to determine their effectiveness. It is important to determine whether the accommodation(s) improve student performance and how the improvement of ELLs compares with improvement for fully English proficient peers. Studies are needed to compare the performance of English proficient peers and ELLs on both the standard and

accommodated versions of the assessment. If performance improves for all, the assessment might be considered a better measure. If performance is improved for ELLs only, a validity study should be conducted to determine how ELL student performance on the modified assessment compares with actual classroom performance.

Research is needed to develop rubrics and scoring procedures that accurately measure student performance. Rubrics that distinguish between errors due to language proficiency and those related to lack of content knowledge and skills need to be developed. Additionally, methods to train scorers are necessary, since without training, scorers have been found to rate the same work very differently. Research is also needed to determine the best methods of reporting and interpreting scores for the school and community, including how to format the information so it is comprehensible for different audiences and how to explain the accommodations. Along these lines, research is needed to determine the credibility of the accommodations for different audiences.

Because of the difficulties in assessing English language learners, it may be important to assess their access to necessary resources and conditions, such as adequate and appropriate instruction. Although there has been substantial work in defining some conditions, such as content coverage and time on task for mainstream students, the research base for defining the most important and effective resources and conditions for English language learners is weak.

[\(Return to Table of Contents\)](#)

What Role Does Native Language Assessment Play in High Stakes Testing?

The panel proposed three areas of interest under which specific research questions were categorized. These include: utilization of assessment investigations; technical investigations; and cost benefits/policy investigations.

Under the category utilization of assessment, research should be undertaken to determine under what circumstances ELLs should take native language assessments and what realistic level of first and second language proficiency should determine readiness for high stakes testing. Research should also examine when ELLs are prepared to take such tests. Questions here concern what types of test taking skills are needed and what kinds of learning opportunities are necessary in order to be ready to participate in such assessments.

Recommended technical investigations include identifying or developing methods of preparing equivalent versions/forms for tests in more than one language, determining how such versions will be normed or scaled, and identifying what cultural and item biases impact student performance on native language assessments. Additionally, research needs to examine how to devise native language assessments that yield comparable results to English high stakes assessments. A final research area for this category involves an examination of the extent to which native language proficiency and literacy are factors in high stakes assessment outcomes.

Under the rubric of cost benefits/policy investigations, research is needed to determine the benefit of conducting native language assessment for different stakeholder groups. A cost benefits issue that needs to be pursued involves knowing when it is practicable or necessary to administer or develop native language assessments. Another research question concerns whether "high stakes" are the same when testing in the native language as opposed to testing in English.

The panel also recommended several additional areas for investigation. Since many local schools and state departments of education are in the process of using and/or designing tests, the panel suggested examining the challenges and attempts test developers have experienced in preparing native language assessments. A survey of the results obtained from these assessments and lessons learned would be useful in directing and refining further research. Other areas in need of research attention include identifying what types of education programs and contexts are necessary for native language testing and what criteria should inform the development and/or selection of a native language assessment for high stakes purposes.

Research Recommendations:

1. What are the consequences (intended/unintended) of using the first language (L1) or the second language (L2) in high stakes testing?
2. What is the relationship between opportunity-to-learn in L1 and L2 and performance in high stakes testing in L1/L2?
3. What are the appropriate proficiency levels of L1 and L2 necessary for high stakes testing in L1 and L2?
4. How do various native language accommodations affect performance on high stakes testing for students at different levels of native language proficiency (e.g., dictionaries, bilingual forms, oral native language instruction, relaxed time limits).
5. Are there conflicting policies relating to high stakes testing for English language learners at the state/district level?

[\(Return to Table of Contents\)](#)

Future Directions

As described above, establishing a research agenda for the high stakes assessment of English language learners poses many challenges in light of the critical issues that must also be addressed. The comprehensive and forward-looking directive suggested by the symposium participants can be used by OBEMLA to guide both the gathering of existing research and the designing of future research projects. In initiating collaborative research efforts with U.S. Department of Education entities such as the Office for Educational Research and Improvement and the Office of Elementary and Secondary Education, with state education agencies, various research institutes and professional associations, OBEMLA can use this document as a basis for designing research plans based on the questions and issues raised in this symposium.
